Normal Distribution

A continuous rv X is said to have a **normal distribution** with parameters μ and σ (or μ and σ^2), where $-\infty < \mu < \infty$ and $0 < \sigma$, if the pdf of X is

$$f(x; \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-(x-\mu)^2/(2\sigma^2)} -\infty < x < \infty$$

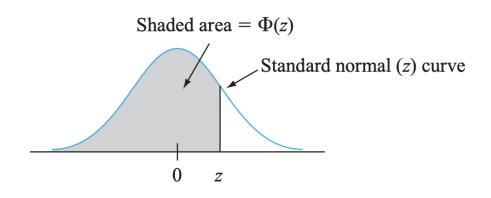

Normal Distribution

$$P(a \le X \le b) : \int_a^b \frac{1}{\sqrt{2\pi}\sigma} e^{-(x-\mu)^2/(2\sigma^2)} dx$$

The normal distribution with parameter values $\mu=0$ and $\sigma=1$ is called the **standard normal distribution.** A random variable having a standard normal distribution is called a **standard normal random variable** and will be denoted by Z. The pdf of Z is

$$f(z; 0, 1) = \frac{1}{\sqrt{2\pi}} e^{-z^2/2} - \infty < z < \infty$$

Standard Normal Distribution

$$\Phi(z) = P(Z \le z)$$

Question

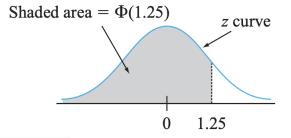

Find out the standard normal probabilities:

- 1. $P(Z \le 1.25)$
- 2. P(Z > 1.25)
- 3. $P(Z \le -1.25)$
- 4. $P(-3.8 \le Z \le 1.25)$

Question

 $P(Z \le 1.25) = \Phi(1.25) = 0.8944$

Z_{α} Notation for Z critical values

Z_{α} covers the upper tail area

Z_a Notation

 α of the area under the z curve lies to the right of Z_{α}

Hence 1 - α of the area lies to the left.

Thus Z_{α} is the (100- α)th percentile of the standard normal distribution.

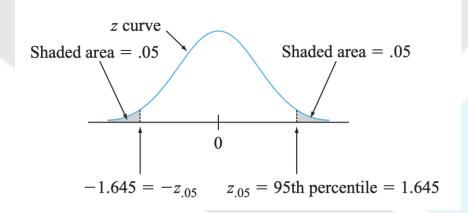

By symmetry the area under the standard normal curve to the left of $-Z_{\alpha}$ is also α .

Normal to Standard Normal

If X has a normal distribution with mean μ and standard deviation σ , then

$$Z = \frac{X - \mu}{\sigma}$$

has a standard normal distribution. Thus

$$P(a \le X \le b) = P\left(\frac{a - \mu}{\sigma} \le Z \le \frac{b - \mu}{\sigma}\right)$$
$$= \Phi\left(\frac{b - \mu}{\sigma}\right) - \Phi\left(\frac{a - \mu}{\sigma}\right)$$
$$P(X \le a) = \Phi\left(\frac{a - \mu}{\sigma}\right) \qquad P(X \ge b) = 1 - \Phi\left(\frac{b - \mu}{\sigma}\right)$$

Question

The breakdown voltage of a randomly chosen diode of a particular type is known to be normally distributed(Not standard normally).

What is the probability that a diode's breakdown voltage is within 1 standard deviation of its mean value?

What is the probability that a diode's breakdown voltage is within 2 standard deviation of its mean value?

What is the probability that a diode's breakdown voltage is within 3 standard deviation of its mean value?

Solution

$$P(X \text{ is within 1 standard deviation of its mean}) = P(\mu - \sigma \le X \le \mu + \sigma)$$

$$= P\left(\frac{\mu - \sigma - \mu}{\sigma} \le Z \le \frac{\mu + \sigma - \mu}{\sigma}\right)$$

$$= P(-1.00 \le Z \le 1.00)$$

$$= \Phi(1.00) - \Phi(-1.00) = .6826$$

If the population distribution of a variable is (approximately) normal, then

- 1. Roughly 68% of the values are within 1 SD of the mean.
- 2. Roughly 95% of the values are within 2 SDs of the mean.
- 3. Roughly 99.7% of the values are within 3 SDs of the mean.

Normal Approximation to Binomial Distribution

Let X be a binomial rv based on n trials with success probability p. Then if the binomial probability histogram is not too skewed, X has approximately a normal distribution with $\mu = np$ and $\sigma = \sqrt{npq}$. In particular, for x = a possible value of X,

$$P(X \le x) = B(x, n, p) \approx$$

$$\begin{cases} \text{area under the normal curve} \\ \text{to the left of } x + .5 \end{cases}$$

$$= \Phi\left(\frac{x + .5 - np}{\sqrt{npq}}\right)$$

In practice, the approximation is adequate provided that both $np \ge 10$ and $nq \ge 10$, since there is then enough symmetry in the underlying binomial distribution.

A direct proof of this result is quite difficult.

Question

Suppose that 25% of all students at a large public university receive financial aid. Let X be the number of students in a random sample of size 50 who receive financial aid. X follows binomial distribution. Calculate the probability that atmost 10 students receive aid.

$$p = 0.25$$
, $np = 50(0.25) = 12.5 \ge 10$, $nq = 50(0.75) = 37.5 \ge 10$

$$P(X \le 10) = B(10; 50, .25) \approx \Phi\left(\frac{10 + .5 - 12.5}{3.06}\right)$$

= $\Phi(-.65) = .2578$
